SculptForge

FACT SHEET
Version 0.11.7 · November 2026

Free, open-source digital sculpting. On every desktop.

SculptForge is a free, open-source sculpting application for Windows, macOS and Linux. It covers the whole job: Parts, subdivision and micro levels, sculpt layers, dynamic topology, voxel and quad remeshing, vertex paint, map baking and facial shapes.

Bridges to Blender, Unreal Engine and OpenUSD. Classic sculpting keys, Blender and industry-standard keymaps built in. No account, no subscription, no licence server.

Poly Haven lion scan (CC0), rendered in SculptForge

LICENCE	PRICE	MADE BY	WINDOWS	MACOS	LINUX
GNU GPL v3.0 or later	**Free**	**Med and contributors**	**10 and 11, x86_64**	**11 or later, universal**	**x86_64 and ARM64**
Source and builds in the open	Optional memberships fund development	An independent open-source project	Installer, portable zip	Apple silicon and Intel; Homebrew cask	AppImage, Flatpak, .deb, .rpm, tarball, AUR

New in 0.11

0.11.0 – 0.11.7

0.11.7	**Coarse preview while orbiting.** Dense scans draw lighter while the view moves and in full detail when it stops.
0.11.4	**Live mode.** An AI tool you connect works in your open window, only after you approve it: it sees the viewport, turns the view, adds strokes. Every step is one undo.
0.11.6	**Studio controls.** One policy file for allowed AI tools and providers, an audit log of every AI step, keys in the system keychain, studio sign-in.
0.11.1	**Quick Remesh.** Shift+R, hold N, or after every stroke; open parts stay solid.
0.11.2	**Big scans keep up.** Orbiting right after a stroke no longer stalls; big brushes finish sooner after the pen lifts.
0.11.0	**Brushes, masks, layers.** Sixty new brushes in six packs, a Masking panel (cavity, peaks, colour, facing), sculpt layers that record Move, Scale and Rotate, stamps that turn with the drag.
0.11.x	**Everyday.** Industry-standard view keys, saved views, UDIM packing, pen pressure per brush, touch and trackpad, signed one-click updates, Chinese interface.

Honest limits

TODAY

- The biggest brushes on very dense meshes still trail the pen on every machine we test, fast desktops included: the stroke lands, but late.
- On entry-level machines a dense scan shows a lighter preview while you orbit; full detail returns when the view rests.
- Opening a scan with micro levels takes seconds, not an instant.
- The largest scans need more memory than an 8 GB integrated-graphics laptop has.
- Entry-level results come from a simulated low-end budget on our machines. Results from real integrated-graphics laptops are welcome.
- Pre-1.0: frequent releases, the occasional rough edge.
- AI features use a tool or provider you connect yourself; nothing AI runs until you turn it on.
